## **Problem definition:**

$$\alpha = 1 \frac{\text{m}^2}{\text{s}}$$

$$\text{Length} = 1 \text{ m}$$

$$\Delta x = 0.1 \text{ m}$$

Compute the solution from  $t = 0$  to  $t = 10$  sec in steps of

1.  $\Delta t = 0.1$
2.  $\Delta t = 0.01$
3.  $\Delta t = 0.001$

Plot the results for  $t = 0, 0.5, 1, 2, 5, 10$  sec.

## **Governing Equation:**

$$\frac{\partial T}{\partial t} = \alpha \frac{\partial^2 T}{\partial x^2}$$

where

- $T$  is the temperature
- $t$  is the time
- $\alpha$  is the thermal diffusivity
- $x$  is the distance

## **Initial Condition:**

$$T = 0^\circ\text{C everywhere}$$

## **Boundary Condition:**

$$T_{x=0} = 100^\circ\text{C}$$

$$T_{x=1} = 0^\circ\text{C}$$

## Numerical Formulation:

Using the FTCS (Forward in time and Central in Space) to discretize the governing equation, we get:

$$\frac{T_i^{n+1} - T_i^n}{\Delta t} = \alpha \frac{T_{i+1}^n - 2T_i^n + T_{i-1}^n}{\Delta x^2} \quad \text{for } i = 2, 3, 4, \dots, 10$$

$$T_i^{n+1} = \gamma T_{i+1}^n + (1 - 2\gamma)T_i^n + \gamma T_{i-1}^n \quad \text{for } i = 2, 3, 4, \dots, 10$$

where  $\gamma = \alpha \frac{\Delta t}{\Delta x^2}$

Imposing the Boundary condition:

$$T_1 = 100^\circ\text{C}$$

$$T_{11} = 0^\circ\text{C}$$

## Algorithm:

1. Initialize  $\Delta t$ ,  $\Delta x$ ,  $N$ ,  $\alpha$ .
2. Initialize  $T_{\text{old}}[i] = 0$  for  $i = 2, \dots, N$  and  $T_{\text{old}}[1] = 100$  (Boundary Condition)
3. Calculate  $T_{\text{new}}[i]$  using the above formulation for  $i = 2 \dots N - 1$ .  
 $T_{\text{new}}[1] = 100^\circ\text{C}$  and  $T_{\text{old}}[0] = 0^\circ\text{C}$ .
4. Swap  $T_{\text{old}}$  with  $T_{\text{new}}$ .
5. Go to step 3 till time elapsed is less than 10 s.

## Input data:

|   | A          | B        | C      | D          | E                     |
|---|------------|----------|--------|------------|-----------------------|
| 1 | $\Delta t$ | $\alpha$ | Length | $\Delta x$ | $\gamma$ (calculated) |
| 2 | 0.1        | 1        | 1      | 0.1        | 10                    |
| 3 | 0.01       |          |        |            | 1                     |
| 4 | 0.001      |          |        |            | 0.1                   |
| 5 |            |          |        |            |                       |

## Results:

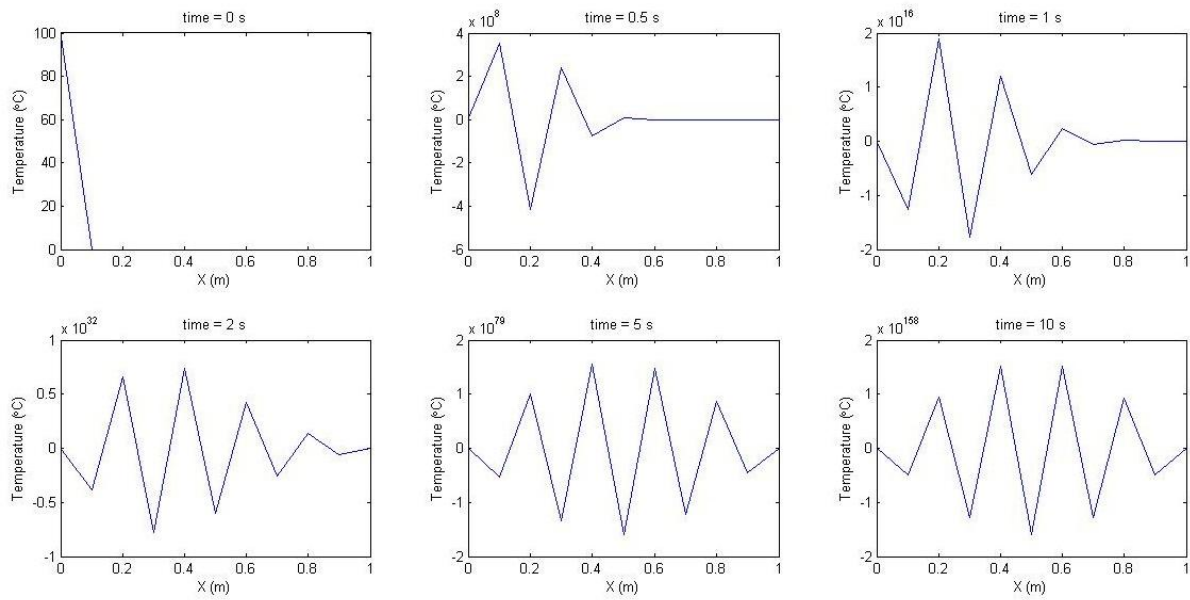

- **Case 1:**

$$\Delta t = 0.1 \text{ s}$$

$$\Upsilon = 10$$

Since  $\Upsilon > 0.5$ , therefore, we see oscillations in this case.

Temperature distribution with  $\Delta t = 0.1$

- **Case 2:**

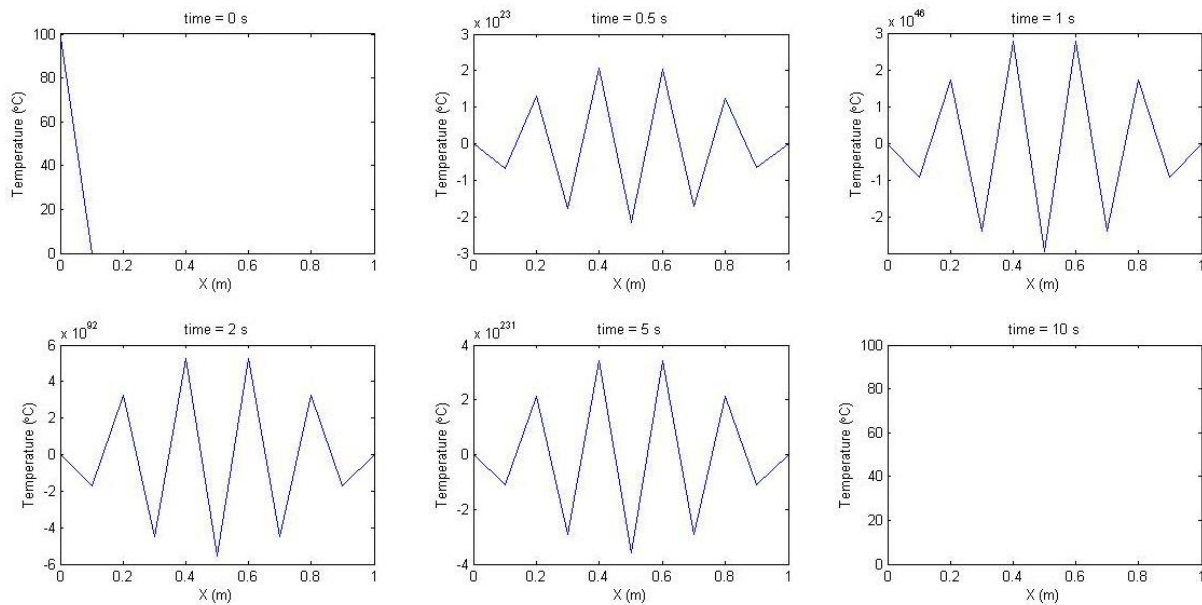

$$\Delta t = 0.01 \text{ s}$$

$$\gamma = 1$$

Since  $\gamma > 0.5$ , therefore, we see oscillations in this case.

At time = 10 s, the temperature began to oscillate between  $-\infty$  (Minus Infinity) and  $\infty$  (Infinity). So we are not able to see any curve.

Temperature distribution with  $\Delta t = 0.01$

- **Case 3:**

$$\Delta t = 0.001 \text{ s}$$

$$\gamma = 0.1$$

Since  $\gamma < 0.5$ , therefore, we do not see oscillations in this case and steady state is attained.

Temperature distribution with  $\Delta t = 0.001$

## Appendix

### Matlab Code:

```
close all;
clear all;
clc;
